Preparing the Gate

1. **Remove** the mounting hardware which is banded to the liftgate.

2. **Verify** mounting bracket kit (Figure 1 and Table 1).

3. **Support** the liftgate; it will not stand upright without the angle irons - only.

4. **Unbolt** and **Save** the two (2) angle irons attached to the liftgate uprights - only (Figure 2).

5. **Remove** and **Save** the two (2) bracket plates attached to the liftgate - only (Figure 2).

Installing the Bolt-on Gussets

1. **Install** the eight (8) 3/8" x 1" button head bolts, lock washers, and nuts in the position shown for your configuration (Figure 3).
   - Original Series bolt-on gussets and button head bolts go to the inside of the 1/4" x 1" strip.
   - G² dual drive bolt-on gussets and button head bolts go to the outside of the 1/4" x 1" strip.

Note: The extra hole in the bolt-on gusset is always below the 1/4" x 1" strip (Figure 4).
Note: If gussets are already welded to the uprights, verify the gusset dimensions (Figure 3) and you do not need the bolt-on gussets.
Preparing the Truck

1. Remove the tailgate and tailgate hardware (Figure 5).
2. Support the rear bumper to keep it from falling while removing the mounting bolts.
3. Remove the rear bumper and bumper mounting brackets.

Note: The tailgate, tailgate hardware, and rear bumper cannot be remounted after the liftgate is installed.

Modifying the Tail Light Mounting

Note: This modification must be completed before the liftgate is installed so that the tail light bulbs can be replaced without removing the liftgate.

1. Remove the two (2) factory tail light screws from each tail light lens (Figure 6). The screws will not be reused after the modification.
2. Carefully Drill a 9/64" hole through each tail light lens and internal sheet metal (Figure 6).
3. Carefully Drill a 3/16" hole through each tail light lens only, for screw clearance (Figure 6).

Note: Do not install the tail lights now if 1500 lb application.

4. Apply clear silicone sealant to the 3/16" holes in the tail light lenses and stainless self-tapping screws.
5. Install a stainless self-tapping screw, supplied, into each 9/64" hole to hold the tail light lenses in place (Do not over-tighten).
Installing the Liftgate

1. Position the mounting brackets into the truck bed in front of the corner posts (Figure 7).
   Do not drill holes for mounting brackets at this time.

2. Position the Tommy Lift into the bed opening. The liftgate should be:
   - Centered in the opening.
   - Flush with the truck bed floor.
   - In a vertical position (level with the ground).

3. Hand tighten each mounting bracket to the liftgate gussets using the supplied:
   - (3) 3/8"x1" hex head bolts on the bracket-side (Figure 7).
   - (3) 3/8" lock washers, and (3) 3/8" nuts on the gusset-side (Figure 7).

4. Allow the liftgate to hang, supported by the corner posts.

5. Hold the bracket against the corner post.

6. Check for obstructions before drilling in the next step.

7. Drill two (2) 3/8" holes into the truck bed floor using two holes in the bracket as a guide.
   Choose two of the four holes provided with no obstructions on the underside (Figure 8).

8. Fasten each bracket to the truck box using the supplied:
   - (2) 3/8"x1" hex head bolts on the top-side (Figure 8).
   - (2) washers, (2) lock washers, and (2) hex nuts on the under-side (Figure 8).

9. Adjust the liftgate so the platform is level from front to back.
   Check the clearance between the truck tail light lenses and the liftgate.

10. Tighten the bolts securing the liftgate gusset to the mounting brackets.
    The lock washer split must not be in the gusset slot when tightening bolts.

Adding Additional Support (G2 1500 lb Application Only)

Note: Additional bracket support is required at this capacity.

1. Locate the existing 3/8" hole in the mounting bracket (Figure 9).

2. Check for obstructions before drilling in the next step.

3. Drill a 3/8" hole in the truck corner post, using the bracket's hole as a guide.

4. Fasten the mounting bracket to the corner post using the supplied:
   - (1) 3/8"x1" hex head bolt on the bracket-side (Figure 9).
   - (1) 3/8" flat washer, (1) 3/8" lock washer, and (1) 3/8" nut on the truck-side (Figure 9).

5. Repeat for the other mounting bracket.

6. Install tail light lenses.
Preparing the Gate for Wiring

1. Attach 12 volts from a battery to the liftgate power cables (no battery chargers).
2. Push the hidden "Power On" switch (Figure 11). The amber "Power On" LED will illuminate.
3. Push the hidden "Liftgate Activated" switch twice within one second. The red "Liftgate Activated" LED will illuminate.
   Note: With both lights on, the liftgate can be raised or lowered. If not used for 90 seconds, the control will automatically shut off.
4. Push the toggle switch down to lower the liftgate to the ground.
5. Remove the box cover by removing the 5/16" hex head bolts or nuts (Figure 10).
6. Remove the following from inside the liftgate mainframe:
   - Owner/Operator Manual
   - License plate light(s)
   - License plate light hardware (G2 only)
   - (1) Vent plug
   - (2) Latch balls with studs (Original Series only)
   - (1) 150 Amp manual reset circuit breaker
   - (4) Copper lugs
   - (2) License plate nuts and screws
   - (1) Padlock with keys
   - (3) 3/8" plastic plugs (G2 only)
   - (1) Drop away pin
   - (1) Lower mounting kit

Routing the Power Cables

1. Install the circuit breaker on the vehicle fender, firewall, or other location inside the engine compartment away from moving parts.
   Leave enough room for the power cables to be installed and so that the circuit breaker can easily be reset.
2. Loosen the strain relief on the back of the liftgate mainframe.
3. Pull the power cable (coiled up in the liftgate mainframe) carefully through the strain relief.
   Leave approximately two (2) inches of slack inside the liftgate mainframe.
4. Tighten the strain relief.
5. Pull the power cables along the frame to the battery following the Tommy Gate Recommended Electrical Wiring Guidelines.
6. Pull the excess cable beyond the battery.
7. Separate the positive(+) and negative(−) leads.
8. Cut the positive(+) lead to the length required to reach the auxiliary (AUX) terminal of the circuit breaker.
9. Cut the remaining pos.(+) lead long enough to reach from the circuit breaker battery (BAT) terminal to the pos.(+) battery terminal.
10. Cut the negative(−) lead to the length required to reach the negative battery terminal.

IMPORTANT: The pump and motor unit for this lift can require up to 205 amps of electrical power at 12 volts D.C.

Be sure that the negative(−) ground lead is connected to the negative(−) terminal of the vehicle battery.

11. Install the copper lugs on all required ends.
12. Connect the circuit breaker and battery as outlined in the Tommy Gate Recommended Electrical Wiring Guidelines and wiring diagram (Figure 11).
Installing the Lower Mount

IMPORTANT: Do not install a liftgate on a pickup without installing the lower mount.

1. Install the two (2) mounting angle irons to the bottom of the liftgate (Figure 12).
   Select the holes in the liftgate that position the angle irons adjacent to the truck frame rails.

   Note: Nuts have been welded to the inside of the liftgate to accept the bolts.
   Note: If the liftgate already has a long angle iron, use it in place of the two mounting angle irons.

2. Bolt the bracket plates to the truck frame (Figure 13).
   Modification to the bracket plates may be required.

3. Clamp the short angle irons to the bracket plates.
   The short angle irons should extend out to the mounting angle irons on the liftgate.

4. Tack weld the bracket plates (see welding note at right), the short angle irons, and the mounting angle irons together.

5. Remove the tacked lower brackets from the truck.

6. Weld all seams with a heavy weld:
   • Where the bracket plates meet the short angle irons.
   • Where the short angle irons meet the mounting angle irons.

7. Bolt the completed brackets back to the truck frame and bottom of the liftgate.

   Note: The lower mount is of great importance because it adds additional support to the liftgate.

Finishing the Liftgate Installation

1. Install the two (2) knobs on the platform latches (Original Series only) see (Figure 14).

2. Unscrew the solid plastic plug from the pump reservoir and Install the vent plug provided (Figure 15).

   Note: The hydraulic system has already been filled with the proper amount of hydraulic oil so do not add any oil at this time.

3. Install the two (2) square plastic insert nuts for the license plate into the square holes on the liftgate.

4. Install the license plate using the two (2) stainless steel screws provided.

5. Install the license plate light(s) into the holes provided.

6. Connect the license plate light(s) to the vehicle's wiring following the Tommy Gate Recommended Electrical Wiring Guidelines.
   The license plate light wire(s) can be run through the strain relief in the back of the liftgate.

   Note: Additional wire may need to be spliced into the license plate light circuit to reach the connection point.
   Note: All electrical splices should be heat shrinked for corrosion protection.

7. Install the 3/8" round plastic plugs into the empty holes in the bottom of the uprights (G only).

8. See the Owner's / Operator's Manual if drop away feature is desired.

9. Install the "Do's and Do Not's" decal in a highly visible area in the vehicle cab.
   This decal is with the Owner's / Operator's Manual.

10. Reinstall the spare tire, if previously removed.
Painting the Liftgate (if needed)

Your Tommy Gate has been primed with a gray polyurethane and painted with a black semi-gloss polyurethane topcoat to protect it from the environment. No additional paint is required unless shipping or installation damage or outdoor storage exposure has deteriorated the Tommy Gate paint. **Tommy Gate will not be responsible for shipping or installation damage or outdoor storage exposure that has marred or otherwise deteriorated the Tommy Gate paint.**

If you need to refinish the liftgate you should do the following:

1. **Remove** any dirt, oil, grease, salt, or other contamination by washing with a mild detergent solution.
2. **Rinse** thoroughly with fresh water and allow to dry.
3. **Lightly Scuff Sand** the Tommy Gate topcoat.
4. **Sand** and **Spot Prime** any area of the Tommy Gate paint that shows signs of damage or deterioration.
5. **Mask** off all safety decals, cylinder shafts and vents before painting.

**WARNING:** Paint overspray on the cylinder shaft(s) or vent(s) will damage the cylinder seals and void warranty.

6. After proper cleaning and surface preparation, **Apply** desired finish coat per paint manufacturer's recommendations.
7. **Remove** the masking from the safety decals and cylinders.
8. **Check** to ensure that all decals are clean and legible. Additional decals are available from the factory, if needed.

---

Testing the Operation of the Liftgate

**CAUTION:** Keep all foreign objects (body parts, tools, load weights, etc) out of the liftgate mainframe and away from pinch points at all times when operating the liftgate.

1. **Check** operation of the safety control for proper lift operation. Be sure the control shuts off automatically after 90 seconds of not being used.
2. **Raise** and **Lower** the unloaded platform on a flat surface looking for proper operating speed and alignment with the ground.
3. **Load** the platform with the rated capacity and **Measure** the time necessary to raise the platform. The platform should raise at roughly 2-3 inches per second.
4. **Examine** the platform for any downward creep.
5. **Time** the lowering operation with the platform still loaded. The load should descend at roughly 7-9 inches per second.
6. **Remove** the load from the platform and **Examine** the liftgate and vehicle for any problems such as hydraulic oil leaks, loose wiring, etc.
7. **Reinstall** the box cover.
8. **Close** and **Latch** the platform.
9. **Lock** the padlock through the hole in the platform or latch pin (Figure 16).
10. **Place** Owner's / Operator's Manual and padlock keys in the vehicle.

---

Figure 16: Padlock location.
WIRE ROUTING
(1) When routing wires, avoid heat (above 180°F), abrasion, vibration, metal edges, screws, and trim fasteners. If such routings are not possible, protective devices must be used. If wires must cross a metal edge, the edge should be covered with a protective shield and the wiring fastened within 3 inches on each side of the edge.
(2) Grommets must be used where wires pass through holes in sheet metal, castings, and / or frame rails. Do not bend wires in a radius smaller than 10 times the wire diameter.
(3) Routing wires into areas exposed to wheel wash should be avoided. If this cannot be avoided protective shields are required to protect the wires from stones, ice, salt and water damage. Provide a drip loop to prevent moisture from being conducted into switches, relays, circuit breakers, and fuses.
(4) Wires should be supported every 18 inches with plastic zip ties or rubber-lined clips.
(5) Wires must be routed to clear moving parts by at least 3 inches unless positively fastened or protected by a conduit. If wiring must be routed between two members where relative motion can occur, the wiring should be secured to each member, with enough wire slack to allow flexing without damage to the wire.
(6) Maintain at least a 6 inch clearance from exhaust system components. If this is not possible, high temperature insulation and heat shields are required. Existing OEM heat shields, insulation, and wire shielding must be maintained.
(7) Do not route or attach electrical wires to fuel lines. Route electrical wires at least 1-1/2 inches away from the engine.

BATTERY, WIRE, TERMINALS, AND CONNECTORS
(1) Wire attachments at the battery must be protected from tension loads so there is no undue strain on the battery terminals. Wires should be routed down rather than horizontally from the terminals with no sharp bends adjacent to the connections.
(2) Battery power for your Tommy Gate should come directly from the battery through the supplied circuit breaker or fuse. The circuit breaker or fuse should be installed as close to the battery as possible.
(3) Do not splice battery cables. If splicing is necessary, the most durable splice joint will be bare metal barrel crimped, flow-soldered and covered with adhesive lined heat shrink tubing. Strip the wire ends making sure that individual conductor strands are not damaged. Use only rosin core solder, proper crimping tools, and wire with a gauge at least equivalent to the circuit being lengthened. Do not use electrical tape.
(4) Battery cable terminals will be bare metal barrel crimped or flow-soldered and covered with adhesive lined heat shrink tubing.
(5) Use wire connectors with locking features such as positive locking, inertia locking, bolt together, and soft mold-over with locking external retainers.

GENERAL
(1) All frame contact areas must be wire brushed to bare metal, free of paint, dirt, and grease. Frame connections must be made using hardened flat washers under the bolt head and lock nuts. Corrosion preventive grease or compound is to be applied to the terminal area of the frame connection.
(2) Frame cross members are not recommended as part of the ground return.
(3) All circuit breakers and fuses should be located in one easily serviceable location with a means provided for identification of circuit function and current rating. Do not put circuit breakers or fuses in the vehicle cab.
(4) Before welding to the chassis disconnect the battery. Also disconnect the power train, engine, valve, and transmission control modules.
(5) Do not alter vehicle ignition, starting, and / or charging systems. Do not reroute engine compartment wiring.
(6) Full copper circuitry and standardized polarity grounds are recommended.
(7) Never increase the rating of a factory installed fuse or circuit breaker.
(8) Disconnect the battery negative (ground) wire prior to any vehicle modification.

Following the above guidelines will provide you with years of trouble free service. Failing to incorporate the above guidelines will result in a voided warranty. Non-compliance with the guidelines above may result in a failure of electrical components, shutdown of engines, loss of backup brake systems, and the possibility of fire.
